Perianal Crohn’s Disease: Current Treatment Approach

David A. Schwartz, MD
Director, Inflammatory Bowel Disease Center
Associate Professor of Medicine
Vanderbilt University Medical Center

New Diagnosis Patient

- 30 yo female presents with 3-month history of perianal pain and drainage. No change in stool habits.
  - Treated empirically with metronidazole, with only minimal improvement
  - Colonoscopy with TI intubation and bx are normal
- FH: Positive for Crohn’s
- PE: Normal except rectal exam which showed…
Patient asks you if she could have Crohn’s disease and does this happen frequently to CD patients or is she just the unlucky one?

She also wants to know what to expect over her lifetime if this is from Crohn’s disease?
Cumulative Incidence of Crohn’s Fistulas

- Any fistula: 100%
- Perianal fistula: 40%
- # observed: 169, 107, 66, 41, 18
- Time from diagnosis (yr): 0, 5, 10, 15, 20

Frequency of Perianal Fistulas According to the Anatomic Location of Bowel Involvement

- Colon only (without recall involvement): 41%
- Small intestine only: 12%
- Combined ileocolic involvement: 15%
- Rectum only: 92%

Anatomy

Anatomic Relationships in the Pelvis

- Rectal columns
- Internal anal sphincter
- External anal sphincter
- Dentate line
- Intersphincteric space
Classification System

Park’s Classification of Perianal Fistulas

A: Superficial
B: Intersphincteric
C: Trans-sphincteric
D: Suprasphincteric
E: Extrasphincteric

External anal sphincter
50 yo male presents with long history of perianal pain and drainage. Recently started passing air and stool when he urinates. No change in stool habits.
- Treated in past with antibiotics, immunomodulators and infliximab
- Several attempts at surgical treatment without success
- Colonoscopy with TI intubation and biopsies are normal

FH: positive for Crohn’s

PE: Normal except rectal exam which showed…
What is the best approach to this problem?

What are his treatment options (medical and surgical)?

Approach to Initial Diagnosis and Assessment
Why is a precise evaluation important?

The key to successful management is to establish adequate drainage of all abscesses and to control fistula healing. An imaging modality should provide a virtual road map for this purpose.

What Happens When Fistulas are Missed at Time of EUA?

- 52% of patients needed repeat surgery in cases where surgery and MRI disagreed
- Fistula recurrence was always at site predicted by MRI

Buchanan et al, Lancet 2002
Studay Results

• A prospective, triple blinded study compared EUS, MRI and EUA in 32 patients with suspect perianal Crohn’s disease.¹

• All three methods showed excellent accuracy in assessing these patients
  • EUS – 91% (95% CI 75% - 98%)
  • EUA – 91% (95% CI 75% - 98%)
  • MRI – 87% (95% CI 69% - 96%)

• Combining either of the imaging modalities with EUA increased the accuracy to 100%.

Options for Therapy
Does Controlling Fistula Healing Make a Difference?

**Response to Treatment**
- **Infliximab Only**: 83%
- **EUA Before Infliximab**: 100%

**Fistula Recurrence**
- **Infliximab Only**: 79%
- **EUA Before Infliximab**: 44%

Requeiro et al. IBD 2003

Comparison of Healthcare Utilization in Patients with CD Perianal Fistulas Treated with Biologics with or without Setons

**Figure 2. Mean Number of All-Cause and Fistula-Related Hospitalizations at Baseline and Follow-Up for NSBB and SBB Cohorts**

**Figure 3. Mean Total Costs of All-Cause and Fistula-Related Hospitalizations During the Follow-Up Period for NSBB and SBB Cohorts**

Fistulas

Perianal Crohn’s Disease – Surgical Treatment Options

- Fistulotomy
- Setons
- Advancement Flap
- Fibrin Glue / Fistula Plug
- Diversion / Proctectomy
Setons

How Setons Help
Seton Placement

Medical Therapy
**Medical Therapies**

- Antibiotics (metronidazole, ciprofloxacin)
- Immunosuppressives
  - Azathioprine
  - 6-mercaptopurine
  - Cyclosporine
  - Tacrolimus
- Biologic Agents
  - Infliximab
  - Adalimumab
  - Certolizumab
Antibiotics – Fistula Response

Fistula Response at 10 weeks

- **Cipro**: N = 10, 40% response, p = 0.43
- **Flagyl**: N = 7, 14% response
- **Placebo**: N = 8, 13% response

Thia et al., IBD, 2008

Antibiotics Improve Fistula healing in Combination with Anti-TNF Therapy

Fistula Response at Week 12

- **A(DA + PIC**): 47% response, N = 76
- **A(DA + Cpr**: 71% response

All patients received adalimumab 160 mg at wk 0, 80 mg at wk 2, and then 40 mg qow. Patients were then randomized to Ciprofloxacin 500 mg bid or placebo.

Azathioprine / 6 - MP

• The 5 controlled trials were summarized in a meta-analysis¹
  – 22 / 41 (54%) of patients who received AZA/6-MP responded vs. 6 / 29 (21%) who received placebo.
  – Pooled odds ratio was 4.44 in favor of fistula healing

The double blinded placebo study of 48 patients randomized to receive 0.20mg/kg/day for 10 weeks. Primary endpoint was improvement defined as closure of ≥ 50% fistulas and maintenance of closure for ≥ 4 weeks.

Tacrolimus (FK-506)

Week 10 Results

Only 10% had closure of all fistulas.

Tacrolimus 43
Placebo 8

p=0.004

Improved

Anti-TNF α Antibody

Infliximab for Crohn’s Perianal Fistulas

Primary endpoint: > 50% reduction in open fistulas

Initial Fistula Response to Infliximab

- 10mg/kg: 56% (p = 0.041)
- 5mg/kg: 68% (p < 0.001)
- Placebo: 26%

N=94

3- Schreiber S, et al. APT, 2011

How Can We Improve Outcomes for Patients with Crohn’s Perianal Fistulas?
45 yo female presents with 5-year history of Crohn’s disease. Has had perianal fistula that has drain intermittently for 4 years.

Presents with 2-month history of perianal pain and drainage.
- Currently on infliximab monotherapy
- Colonoscopy with TI intubation and biopsies shows active proctitis

PE: Normal except rectal exam which showed…

She asks what can be done to get increase her chances of healing and get her fistula to stop draining for good?
The Use of Imaging to Guide Therapy

MRI to Guide Therapy with Infliximab or Adalimumab

Medical therapy was increased if no or partial response seen on MRI

Ng et al. Am J Gastro 2009
MRI to Monitor Therapy

- 41 pts, serial MRIs, 3 years’ follow-up
- Patients with early response (6 weeks) had 5x ↑ rate of remission (p=0.004)
- All patients (7) who continued the TNF after achieved MRI healing maintained remission
- Improvement plateaued at 1 year

Tozer, et al. IBD 2012.

Utilizing EUS to Improve Fistula Healing

- Complete Cessation of Drainage
- Active Fistula

Initial: 86
Long-term: 76

Schwartz et al, IBD 2005
2 Randomized Prospective Studies Looking at EUS to Improve Outcomes

Initial Prospective Pilot Study

Recent Follow-up Prospective Study

Conclusion

1. History and physical exam
2. Endoscopy to assess activity of Crohn’s disease
3. Imaging study (EUS or MRI) to delineate perianal disease process
4. Exam under anesthesia (EUA)

Simple fistula without rectal inflammation
- Antibiotics and AZA/6-MP
- Consider anti-TNF

Simple fistula with rectal inflammation
- Antibiotics, AZA/6-MP & Anti-TNF
  (consider monitoring healing with repeat imaging study)

Complex fistula
1. Seton placement
2. Antibiotics, AZA/6-MP, & Anti-TNF
  (consider monitoring healing with repeat imaging study)

Treatment Failure
1. Fistulotomy
2. Consider fibrin glue, fistula plug or endorectal advancement flap
3. If 1 or 2 fails, treat as complex fistulizing process

Treatment Success
Continue maintenance AZA/6-MP & Anti-TNF

Treatment Failure
Treat as complex fistulizing process

Treatment Success
Continue maintenance AZA/6-MP & Anti-TNF
1. Consider Tacroliimus in selected pts
2. Proctectomy

Treatment Failure
1. Remove seton
2. Continue maintenance AZA 6-MP & Anti-TNF
