38-year-old Asian American male with dyspepsia is diagnosed with coronary artery disease. Her primary care physician would like to start her on a baby aspirin. Which of the following statement is true?

A. He should be placed on misoprostol for PUD prophylaxis
B. He requires an upper endoscopy for gastric mapping given his increased risk of stomach cancer
C. He should be placed on H2 blocker for PUD prophylaxis
D. He should be tested for Helicobacter pylori and if present eradicate

Answer D
Helicobacter pylori increases the risk of complicated ulcer in someone starting NSAID. It is beneficial to screen naïve NSAID users for H. pylori prior to starting NSAID.
