A 49-year-old male with no history of pancreatitis has a CT scan showing a 1.8 cm pancreatic cyst without mural nodules and with a normal main pancreatic duct caliber. What is the next best step in management?

A. EUS now
B. MRCP in 1 year
C. MRCP in 2 years
D. Surgical referral

Answer: B

Rationale: For pancreatic cysts without high risk features and no history of pancreatitis the recommendations vary based on the size; for cysts <1 cm in size MRI should be performed in 2 years, for cysts between 1 and 2 cm MRI should be performed in 1 year and for cysts between 2 and 3 cm EUS should be performed if it is not clearly an IPMN on imaging.
