A 45-year-old otherwise healthy female presented with painless jaundice to your office. On evaluation she was found to have a 2 cm cystic lesion in the head of the pancreas compressing the bile duct. EUS of this lesion showed a microcystic lesion with honeycomb appearance. The pancreatic duct was 3 mm in the head of the pancreas. Remaining pancreas was normal. What would be the next best step in managing her pancreatic cyst?

- A. MRI with MRCP in 3-6 months
- B. ERCP with biliary stent
- C. Refer for pancreatic surgery
- D. EUS FNA of pancreatic cyst
- E. No further surveillance

**Answer: C**

Rationale: Symptomatic pancreatic cysts irrespective of size in a surgically fit patient should be referred for pancreatic surgery.
