A 64-year-old female with a history of diabetes has a CT scan performed for episode of abdominal pain. The CT is unremarkable other than a 2.3 cm anechoic cystic lesion in the pancreatic tail without nodules or septations. What is the next step in management?

A. Surgical resection  
B. EUS  
C. MRI in 1 year  
D. MRI in 2 years

Answer: B
The cyst is 2.3 cm in size and cysts between 2 and 3 cm should have EUS for further evaluation.
