A 24-year old male with primary sclerosing cholangitis is seen in the emergency department for abdominal pain, nausea and vomiting. A gallbladder polyp is noted on ultrasound. The remainder of his ultrasound is virtually unchanged from his prior imaging. He is managed conservatively and discharged. He sees you in the clinic for follow up.

You recommend a cholecystectomy if the gallbladder polyp measured to be at least:

A. 4 mm  
B. 5 mm  
C. 6 mm  
D. 8 mm  
E. 10 mm

**Answer: D**

Data suggests that a polyp size of at least 8 mm has utility in predicting the presence of gallbladder neoplasia.
